Introduction

IN this directory we have endeavored to give the farmers of Fountain, Parke and Vermillion counties, a complete and reliable directory of the farmers, breeders and merchants of the counties, with such other information as will make the directory a valuable reference book.

The task of calling on every farmer in a county and collecting the information for such a directory is a tremendous one. We have received splendid co-operation from the farmers and business men of the county, without which the publication of such a directory would be impossible. In a very few cases we have found farmers unwilling to give the information requested, which accounts for a few names that do not appear.

A few mistakes are bound to occur in a directory that involves so large an amount of work, but we have spared no effort nor expense to make the information complete and accurate, and believe that the mistakes are very few.

We want to speak a word of appreciation for the advertisers whose liberal support has helped materially to bear the heavy expense of publishing this directory, and ask that you favor them with your patronage whenever possible.

We hope and believe that the publication of this directory will be a real service to the farmers of Fountain, Parke and Vermillion counties and in line with PRAIRIE FARMER'S policy of service to the farmers of Indiana. We hope that the increased circulation of PRAIRIE FARMER in Fountain, Parke and Vermillion counties, which has resulted, will help in the movement for better farming, better farm living, and more prosperity for the counties, and that our many new friends will become permanent members of the big PRAIRIE FARMER family.

BURRIDGE D. BUTLER,
Publisher, Prairie Farmer.

THE FARMER

The Service this Bank renders the farmer is of the highest most satisfactory character. We seek to serve him not only with a place in which to keep his money, but in the character of busine friend. We are glad to place our services and facilities at his com mand either by mail or in person.

YOU CAN BANK WITH US BY MAIL.

Binder Troubles and Adjustments

By C. O. Reed, University of Illinois, in Prairie Farmer

To have to await the services of an expert when every minute of the harvest days is money is not only an expensive practice, but in most cases is an unnecessary one if the operator will only use patience and good judgment and try to understand a few very simple principles of what seems a complicated machine. The purpose of this article is to aid the operator in his most common binder troubles. To cover the ground in the most logical and concise manner, let us consider troubles under the three general heads: general binder troubles, binder head troubles and knotter head troubles.

Starting. If possible, start the new machine on a road or in a pasture before going into the grain field. Use plenty of kerosene and run the machine empty for about five minutes, taking notice that every duct to bearings and every oil hole is open. Then apply lubricating oil. When you are ready to enter the grain with a new machine, raise the machine well up, tilt the platform forward; open the throat of the machine by throwing the butt adjuster forward and start in with about one-half of a full swath. After five minutes work the machine is ready for maximum results. If compelled to make a full swath at the start, cut the grain extra high.

Never change the adjustment of a new binder head before going into the field. It may miss a few bundles at first, but do not adjust. Apply a liberal amount of coal oil to the knotter head and the trouble will usually disappear.

New Machine Failing to Start. Occasionally a new machine fails to start due to some part sticking or catching. Throw the binder out of gear and see that the bull wheel revolves without catching. Remove the elevator chain and throw in gear. This will test the sickle. Next put on elevator chain and throw off reel chains. This will test the rollers. Then connect and test the reel. This method will test one part at a time and should locate the trouble without difficulty. In testing out head for failure to revolve, operate head by hand at back of machine through shaft which drives head from elevator chain.

General Binder Troubles

Chains. Undue wear in chains may be caused by the chain being run too tight or backwards. Run the chain with the hooks of the links leading and with the openings of the hooks out. The use of oil or grease on chains, if the binder is being run in a sandy country or under dusty conditions, is not to be recommended, for the oil will collect the fine particles of grit and cause excessive wear. Under such conditions use dry graphite. Chain jumping is caused by the chain being too loose or by the sprocket being badly worn. If a worn sprocket is the cause for the trouble a new one will have to be supplied.

Canvas Troubles. The creeping of canvases is caused by running them too loose or by the elevators not being square. Test the elevators to see if they are square by means of measuring the diagonals, and then square by the special apparatus to be found for that purpose. Have the canvases of the same tightness on both sides.

Canvases not elevating the grain may be caused by missing slats or loose canvases. Broken slats are generally caused by the elevators not being square, or by the canvases not being buckled evenly and thus the slat is forced to pass over the roller at an angle to it. Chewed slats may be caused by a projecting bolt or the canvas guides being out of shape.

Heavy Draft. Heavy draft may be caused from lack of sufficient good lubricating oil, bull wheel being entered in quadrant wrong; chains, especially main drive chain, being too tight; paint or varnish not being cut out of the bearings; or rollers binding. Apply lubricating oil to the bearings. Enter the bull wheel in the quadrant square. Have the proper tension in the chains. Coal oil will cut the paint

or varnish from bearing surfaces. When machine is empty, operator should be able to move elevators by hand on elevator chain.

Sidedraft. Sidedraft in a binder refers to such resistance of the platform end of the machine as to cause a "dragging" of platform, and hence results in a tendency to run the machine into the grain. It may be caused by (a) grain wheel bearing too light; (b) grain wheel being out of proper adjustment; (c) sickle parts not cutting properly, resulting in a pulling off of stalks rather than cutting; (d) very light grain may give a condition where sidedraft is more noticeable, and (e) a fast horse on the outside may lead the operator to believe he has sidedraft.

Remedies. (a) See that grain wheel revolves freely and perfectly on axle. If axle, bearings and wheel bell are badly worn, replace. (b) The inexperienced operator cannot tell whether a grain wheel is aligned properly or not. It should lead out of the grain slightly, and in case of poor alignment here, an expert must be called. (c) Obvious. (d) Sidedraft here is an advantage rather than an objection for it indicates the best construction. (e) Put fast horse on inside.

If difficulty is experienced in getting far enough into the grain with a tongue truck attachment, make adjustments to increase the angle between the platform and tongue proper, i. e., without changing position of machine make adjustments to let horses away from grain slightly. If machine runs too far into grain, make adjustments to bring horses a little closer to grain line. These adjustments can be found between tongue and stub tongue on the McCormick and Milwaukee binders, and in the truck axle braces on the Deering. If sufficient adjustment is not provided in the Deering to permit a full swath, turn the tongue over.

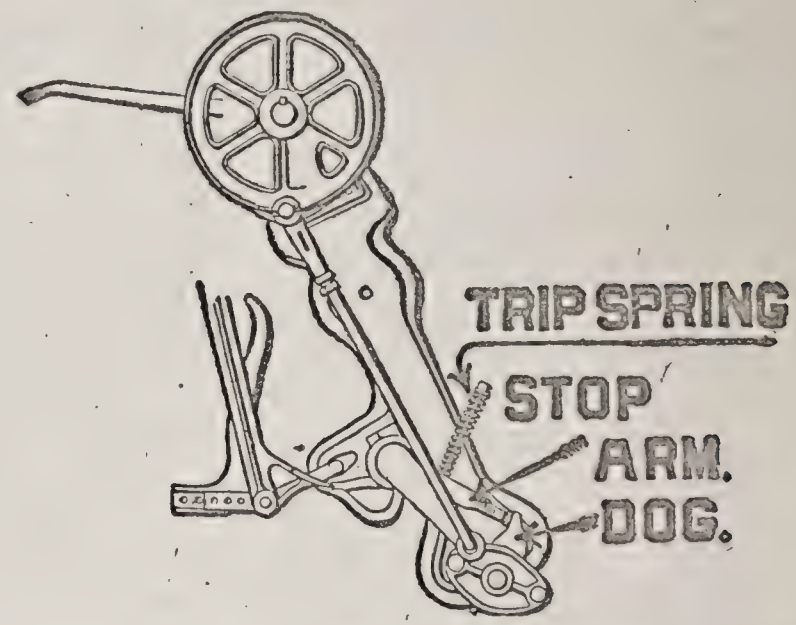
Badly Shaped Bundles in good grain are caused by improper manipulation of binder parts. Set the reel to strike straws about two inches below the heads. Run the butter as near at right angles to the rollers on tier shaft as possible, even if you have to sacrifice an inch or two in the position of the band on the bundle. Do not expect the butter to shove the straws down under the breast plate. Adjust the position of the head to bring the straws under the breast plate and then adjust the butter to smooth the butt of the bundle. In uneven grain the head, butter and reel must be shifted often to obtain the best results. In very short grain or in down grain leaning toward the elevators we have probably the worst conditions for good bundle making, especially for eight-foot binders. First, do all possible to retard the heads by running the platform as level as possible and place a rope head-retarder across the platform, tying the same to the outside divided frame. A rope head-retarder is often found to give better results than the retarding strap iron sent out with the machine, but if the latter is used, the operator will find that he gets very good results in retarding heads by bending up or crinkling the end of the strap iron. Throw the head as far forward as possible and run the butter as near perpendicular to the rollers as possible to still have the bundle securely tied. Tighten the front grain check.

Badly Shaped Bundles in Long Tangled Grain can be remedied by loosening all grain checks slightly and by adjusting the head to tie a smaller, looser bundle.

Getting Grain Down to Packers. Trouble is sometimes experienced in getting light, fluffy grain down to the packers. See that the deck roller is working properly and lower the deck cover.

Choking Down. Sometimes in heavy, fluffy and tangled grain, and often in flax, the head cannot discharge a bundle and is stopped by "choking." Adjust the head to tie a smaller, looser bundle, loosen all grain checks and loosen the tension on the compressor spring, which is the spring attached to the compressor rod.

Bundles Too Loose or Too Tight. Tighten or loosen the trip spring shown in Illustration 1 and described below under "Binder Head Troubles." Do not attempt to make a tight bundle by tightening the twine tension on the twine can. The twine tension is not for the purpose of affecting the



tightness of bundles and if it is used for such purpose serious needle troubles will result. The twine tension should be sufficiently tight to keep back slack in the twine between the can and needle.

Bundles Too Large or Too Small. Move the compressor arm nearer or farther away from the needle. The compressor arm is that arm against which the bundle is formed and as it is moved in or out that space in which the bundle is formed is changed.

Reel Troubles. Short oats is often the cause for considerable reel trouble, especially reel breakage on those machines which have no outside reel support. The operator cutting short oats will necessarily have to tilt his platform well forward and run his reel low. This means that occasionally the reel slats will whip down onto the guards and result in broken parts. Farmers in some localities have solved this difficulty by tacking on to each reel slat a piece of heavy linoleum about six inches wide. The reel can then be run higher, for this extra piece on the slats serves admirably to force the grain over onto the platform and at the same time is sufficiently flexible to give if the reel is whipped down on the guards.

Binder Head Troubles

Before taking up binder head troubles let us refer to the first illustration and get clearly in mind the exact function of the parts mentioned. Every operator is aware that his packer shaft revolves continually and that at certain moments it must drive the whole binder head while the bundle is being tied and cast. The dog, shown in the illustration, is that mechanism which throws the head in motion with the rest of the machine, or it is that mechanism which momentarily engages the head with the continuous motion of the packers while the bundle is being tied. Sufficient pressure by the straw on the trip arm raises the stop arm, shown in the illustration, which allows the dog to be forced into the path of the continually revolving binder head driver. A little spring attached to the dog forces the dog into the path of this driver when the dog is released, and this same spring holds the dog in this path until the stop arm can drop back into place and force the dog back out of the way of the revolving drivers of the packer shaft. When the dog is thrown back out of the path of the binder head drivers, the motion in the head ceases and the dog, if properly working, must remain engaged with the packer shaft until the discharge arms make a complete revolution. The continuity of motion in the head depends upon the dog.

Discharge Arms Fail to Start or Fail to Revolve Completely. This is a dog trouble. See that the dog spring is in place and is of sufficient strength to hold the dog in the path of the binder head drivers when the dog is

released. See also that the striking faces of the dog and dog driver are not worn sufficiently to permit them to slip by one another. If the discharge arms revolve by jerks it is very probable that a worn condition in the striking faces is the cause.

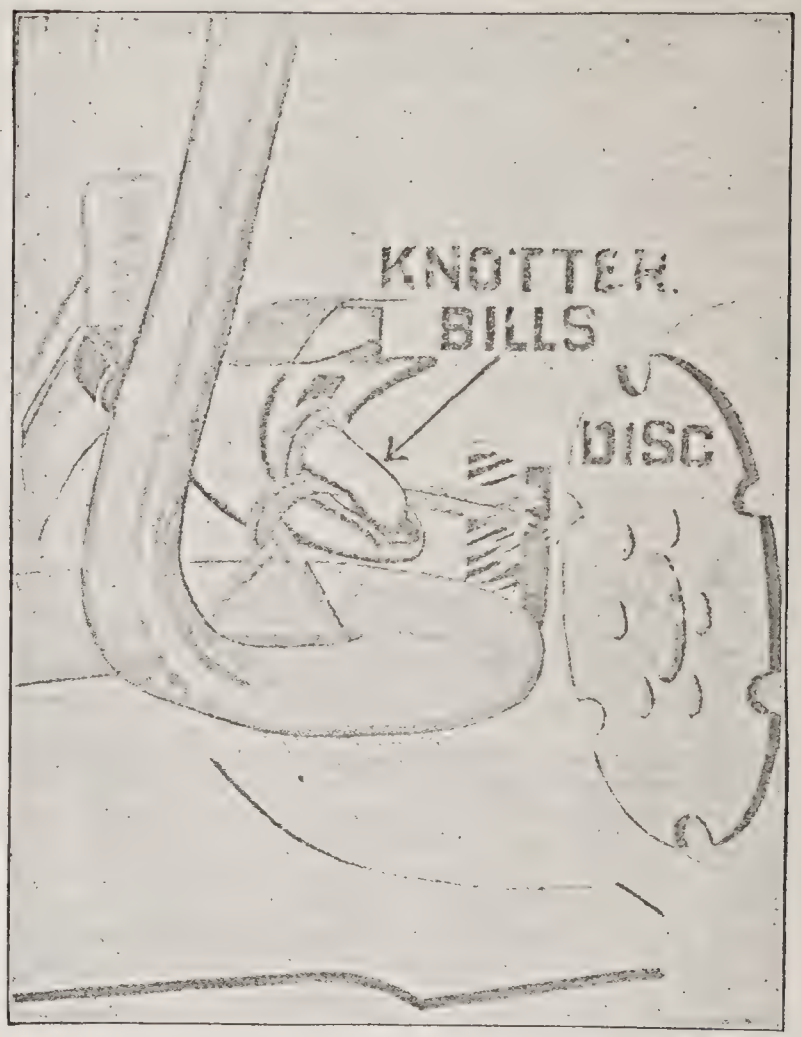
Discharge Arms Revolve Continually. Before discussing this trouble a word should be said regarding timing. It will be noticed that every part of the binder head except the packers works at a certain moment in relation to other parts The dog makes a certain number of revolutions before the stop arm is allowed to drop back into place to throw the dog out of engagement with the binder head drivers. Hence the relation between the stop arm and the dog is a set relation maintained through beveled gears. If for any reason these gears are separated and not put back in the original definite relation to each other, the head is said to be out of time. This means that the stop arm would not be in place at the proper moment to throw the dog out of engagement and a second revolution of the discharge arm immediately follows the first. The timing principle holds true in all makes of heads and is obtained in a way more or less common in all types, though the mechanism will vary to some degree in its shape and position. If the discharge arms revolve continually the head may be out of time or the stop arm face may be so badly worn that it allows the dog to slip by when the two come together. If the machine is out of time, i. e., if the stop arm is not in place to throw the dog out in the proper time, time the head by properly meshing the beveled gears between the packer shaft and the binder head counter shaft which runs up to drive the tier shaft. If the striking faces between the dog and the stop arm are so worn that they slip by one another, file the faces to their original form. If this allows too much play or looseness in the dog (which can be tested by taking hold of the discharge arms to determine whether they are tight or loose) a new dog or perhaps a new stop arm must be purchased. Some machines permit lengthening of the stop arm. Look for such adjustment and use same to hold the dog back tighter.

Casting Very Small Bundles. There are two causes for this trouble. The dog may not be thrown out at the proper time, and the remedy for such a condition has been just stated above. Small bundles often appear in badly tangled grain when the case bundle is not cleaned from the machine and its weight trips the head again immediately and a small bundle is cast which seems to be really a part of the first. Manipulate the machine to make a clean bundle, loosen the grain checks, adjust the trip spring to tie a looser bundle and adjust the compressor arm to tie a smaller bundle.

Discharge Arms Not Set Tight, or Dog Drive Strikes Dog. Usually these two conditions accompany one another and are due to extreme wear in gears and dog, or tier shaft lock may have become loosened. The tier shaft lock is usually a little dog working behind the tier shaft cam wheel at the end of the tier shaft. It holds the discharge arms in place when they are at rest. Examine your binder head for this mechanism and if it can be adjusted usually the trouble can be remedied by such adjustment. If the cam track in tier shaft cam wheel acts as the lock, new parts may have to be added to relieve badly worn conditions, but this will not necessarily remedy the striking between dog and driver. If head is very badly worn and all gearing has considerable play, the dog may be advanced one cog which will bring the head into better time. Great care must be used in doing this, however, for it often happens that a head so treated will work perfectly when operated by hand, but when driven by the packer shaft under actual conditions the tier shaft is not compelled to complete its revolution and this is not "driven home" and locked. This will then result in the discharge arms dropping down and in greater interference between dog and driver. It is sometimes found necessary to replace badly worn gears, in order to entirely eliminate this trouble.

Knotter Head Troubles

All binders are very similar. They combine the same principles, and although the detail of the mechanism may differ somewhat, still for every vital part on one make of machine



there can be found on each other machine a part similar in function, very similar in shape, and often very similar in position. This is particularly true in the knotter head or that portion of the binder head which ties the knot. In discussing these troubles then, let us bear in mind that every make of binder has in some form each part shown in the second illustration, and that the functions of these parts are the same though the position and shape may vary slightly.

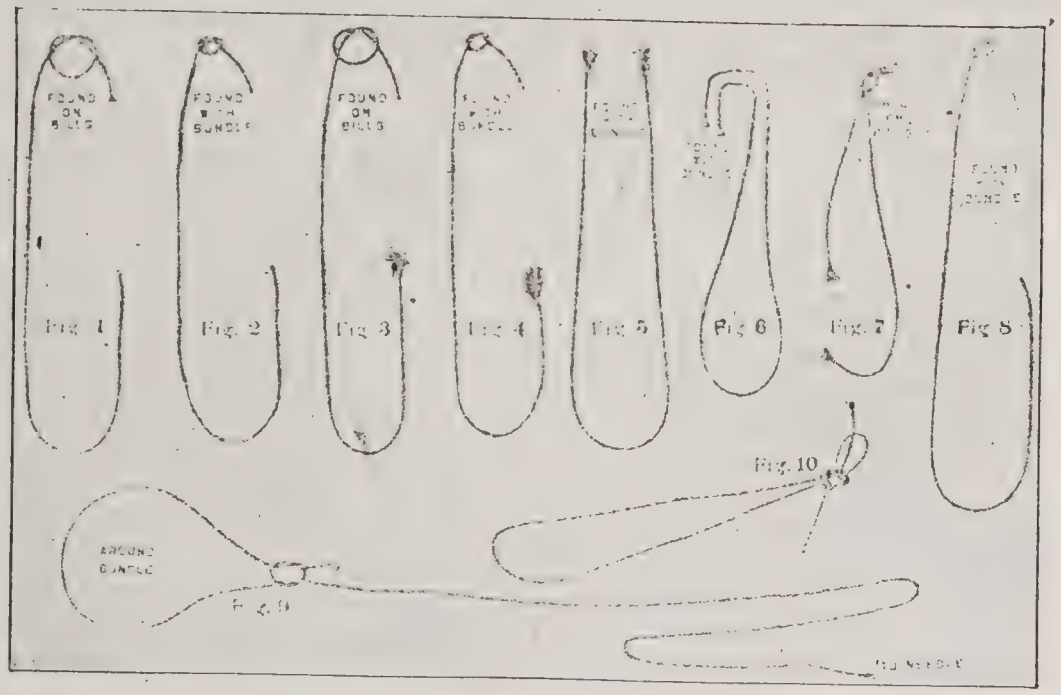
The disc is that part which holds the end of the twine while the bundle is being formed. The bills, also shown in the illustration, are those parts which tie the knot. It is the function of the needle to bring up the needle end of the band, place it over the bills and into the disc where the disc catches it and securely holds both ends. The bills then revolve, forming a loop about themselves, and after revolving part way they open, seize both ends of the band, as shown in the illustration, and hold the ends of the band while the stripper arm pulls the loop off the bills—hence the ends of the band are pulled through the loop and the knot is tied. If these operations are kept clearly in mind the operator will find his tying troubles greatly simplified.

Each operator should be able to tell just where his trouble lies by examining the failing band and noting where it is found.

In the third illustration, Figure 1 found clinging to the bills with the simple knot tied around the bills and the loose end cut square and smooth, indicates that the disc spring is too loose and the twine tension is too tight.

The same band found cast with the bundle instead of clinging to the bills would indicate that the disc is but slightly loose, yet too loose. The band indicating such trouble is shown in Fig 2.

Fig. 3 found clinging to the bills



but with the free end crushed and ragged indicates that the disc is too tight and that the twine tension is also too tight.

Fig. 4 found cast with the bundle instead of on the bills indicates that the twine tension is perfect but that the disc is slightly too tight.

Fig. 5 found with the cast bundle and with both ends crushed and ragged indicates that the disc is very tight.

Notice the bent crinkled ends in Fig. 6 and that the band is formed with the bundle. The ends have been in the knot but have pulled out. The bills may be too loose or the "hump" on the underside of the upper bill may be worn away sufficiently so that the bills cannot hold the ends of the band securely enough when the loop is pulled off. This probably has caused a loose knot which pulled out when the bundle spread. If the bills are too loose tighten the bills spring. If the little "hump" is worn away file away a little of the stock behind the hump, using a rat-tail file.

Fig. 8 is the familiar band which seems to be tied perfectly when the bundle is first cast, but when the shocker grasps the bundle the band gives way and appears as shown. If the disc is at the proper tension, then the trouble is probably that the bills do not open wide enough to grasp both ends of the twine in the disc. If the bills cam roller on the back of the upper bill is worn one-sided, supply new parts. If the whole bills shaft has dropped down due to wear below the bills, pinion gear, place a very thin washer under pinion to bring the bills up against the knotter head frame where they belong. It sometimes happens that a very loose twine tension allows sufficient slack in the twine to arch slightly over the bills instead of being pulled down tightly over them. The upper bill will then nose in between the bands' ends instead of grasping both of them and a simple slip knot is tied instead of a hard knot.

Fig. 9 indicates a needle trouble. For some reason the needle has not placed the twine in the disc. Most likely the needle has carried up some green stuff of some kind which momentarily clogs the disc. If this band occurs frequently, however, then probably the eye of the needle has become so badly worn back, due to too tight a tension, that the needle can not advance far enough to place the twine in the disc. The needle should advance until it just barely touches the stripper or breast plate. If it does not advance that far it is probably slow and the needle pitman should be shortened slightly.

Make all binder head and knotter head adjustments gradually. A quarter of a turn of the studs on the disc and knotter bills springs is ample to remedy most troubles in those parts.

Corn Planter Adjustments

By C. O. Reed, University of Illinois, in Prairie Farmer

Not all of our implement troubles are to be found in the plow or in the binder. The corn planter has troubles of its own, and it is the purpose of this article to discuss some of the corn planter principles and troubles that are often misunderstood.

Accuracy in Drop

Some corn growers say that accuracy of drop is not an important factor with them because two kernels in one hill and four in the next gives an average of three kernels per hill and that is the number desired. The fallacy of this statement is very apparent when we stop to consider that in such planting we have not the desired three kernels in either hill; and if the soil is three-kernel soil, two kernels per hill are too few while four kernels are too many. The result is probably a loss in each hill.

A certain soil may give the best yield with either two, three or four kernels per hill, but after it has been ascertained which number of kernels is best every effort should be made to secure that number in each hill where the soil conditions remain constant. The variable drop devices on planters afford ample opportunity to shift from two to three or from three to four kernels per hill as the soil conditions through the row may demand, but the advisability of permitting inaccuracy in drop from hill to hill is questionable.

The first two requisites for accuracy in drop are (a) seed of uniform size, and (b) the selection of the proper seed plate. Hand tipped and butted corn or machine sorted corn will give seed as uniform in shape and size of kernel as is practical, but unsorted seed may be relied upon to cause inaccurate dropping.

Testing out the planter to make sure that the proper plate is used is to be strongly advocated. Last year's plate may not be the best one for this year's seed, for if there is a slight difference in the average size of kernels between the two years, a corresponding change may be necessary in the size of the seed pits in the plate used. The following table taken from laboratory tests shows the danger of carelessness in selecting the seed plate. The planter was set to drop three-kernel hills, and the plates "small" and "large" were plates next size smaller and next size larger than the proper or right sized plate found.

	Small sized plate	Right plate	Large plate
Per cent of blank hill.....	9.34	.00	.00
Per cent of hills containing 1 kernel	29.36	.26	.28
Per cent of hills containing 2 kernels	37.54	8.66	5.3
Per cent of hills containing 3 kernels	20.48	88.12	81.28
Per cent of hills containing 4 kernels	2.66	2.84	11.48
Per cent of hills containing 5 kernels	.62	.12	1.66

These figures tend to show that a slight mistake in plate selection may lead to a direct loss in stand. There may be but a very slight difference between two pairs of plates—so slight perhaps that we can not detect the difference by eye—but a test of the two pairs will quickly show that one of those pairs means a good drop while the other pair is dangerous and its use should be avoided. Testing can be done when time at the barn permits and will not only mean a saving of time in the field but will also enable the operator to avoid a mistake before it is too late.

Each operator will have his own method of testing out the planter but he should heed these three rules: (1) Let each test consist of at least 50 or 60 hills; (2) run the planter parts at field speed; (3) do not give up until the best plate is found. Probably the quickest way to test is to run the planter in the farm yard, providing the chickens do not get the corn before we can count it. Rainy day testing on the barn floor is a little more troublesome but can be very successfully accomplished by two persons as follows: Jack the planter up over a blanket stretched tight on the floor so that the furrow openers will be about three inches above the blanket when

the depth lever is thrown forward. One man can then turn the drive wheel, trip the check arm and call out the number of kernels dropped, while the second person records the count. After each hill is dropped the kernels are brushed away by foot of the man turning the drive wheel. Glancing at the drop without recording the count simplifies the process but it is not an accurate method and should be avoided when possible.

Accuracy of drop may be secured further by keeping the seed hoppers at least half full at all times.

Blank Hills at the Ends of Rows

Accuracy of drop depends also to some extent upon the speed of the valve. It sometimes happens that at one end of the row we will happen to stop the team just as the button on the check wire has begun to force the check arm. The valves work so slowly at such a time or stop at such a point that in some planters the seed at the top of the boot drops clear through to the ground instead of being intercepted at the bottom of the boot. Two hills drop at once, then, and when we have turned around there are no kernels at the lower valve ready for the first hill on the return trip. On some planters we may overcome the difficulty by foot dropping one hill while the team is turning. On other planters the only remedy is to stop sooner at the end of the row or to drive ahead at usual speed until the wire has released the check arm.

Accuracy in Check

Considerable attention is usually given to securing accurate checking, but a word regarding the adjustment will not be amiss. Accurate checking means possibility of closer cultivation and less loss by cultivating out hills. The manufacturer has found that under usual conditions the check wire will travel from one to three inches across the field, and inasmuch as the slack will always be ahead of the machine, he designs his planter to drop the hill at a distance behind the button equal to one-half the travel. On the return trip the hill is again dropped behind the button and thus the hills should check in spite of the wire travel. It can readily be seen then that if our shoes or furrow openers are dropping nearer to or farther away from the button than half the wire travel, our system for securing good checking will be materially interfered with and adjustments must be made at A in Fig. 1.

This tongue adjustment will vary on the different makes of planters. On some it is at the rear end of the tongue, but it will be found on all the popular makes. As a rule the front frame of the planter should be run level, and it can be so run with a properly drawn check wire. But different tensions on the wire drawn by different drivers may necessitate throwing the front frame slightly out of a horizontal position. If the planter drops too close to the button, make such tongue adjustment as will drop the furrow openers back a little toward the wheels. To some extent tightening the check wire will accomplish the same result in the check. Forcing the furrow openers a little ahead by means of the tongue adjustment will cause the hill

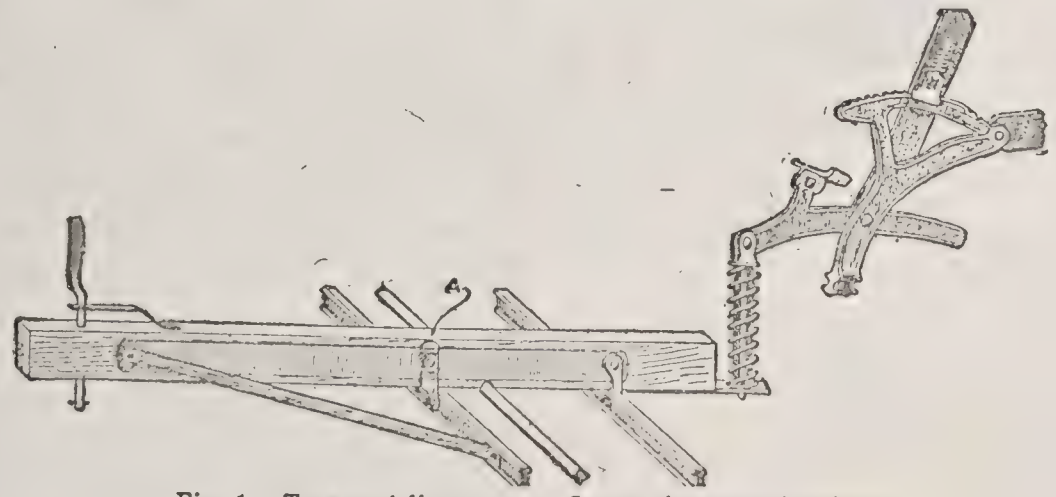


Fig. 1. Tongue Adjustment to Secure Accurate Checking

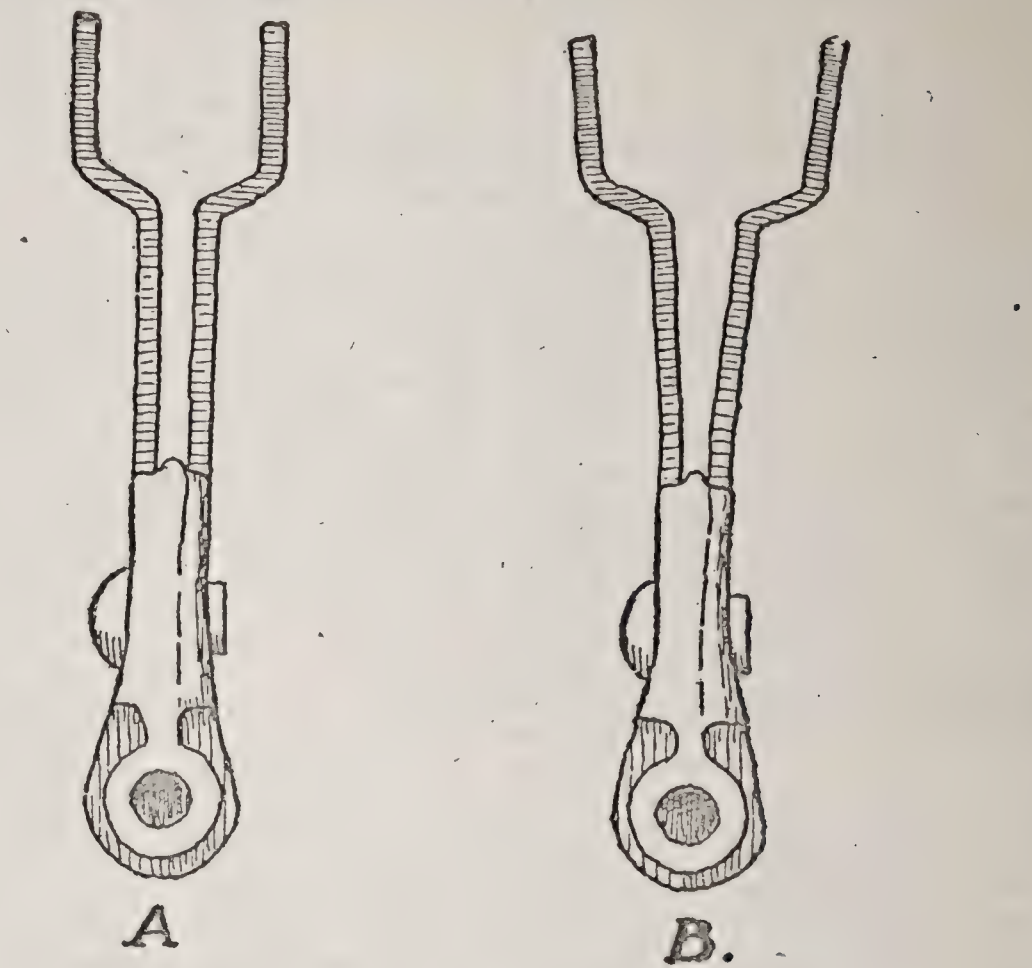

A Spread Check Fork May Cause Stringing

to be dropped a little close to the button, or having the check wire a little more slack will have the same result in the check. In testing for accuracy of check by digging up hills, select hills pretty close behind the planter. Adjusting the neckyoke straps will also affect the check. The adjustment shown in Fig. 1 is also a means of maintaining a good check when different heights of teams are used and when the difference cannot be compensated for by adjusting the neckyoke straps.

Uniform tension in the check wire must be maintained if accurate checking is to result. Some drivers even go so far as to make allowance for the expansion and contraction of the check wire due to varying temperature from day to day, but this is getting too particular to be practical. It is practical, however, where planting is being done up and down a slope, to pull the wire tighter when setting the high stake.

Uniform Depth of Planting

In planting over a rough field, a more uniform depth can often be secured by floating the furrow openers, but when this is done the operator should keep the openers under foot control so that the shoes may be forced to their depth in dry spots and kept from planting too deep in moist, soft spots. There are a number of shoe gauges now on the market which attach to shoes to insure uniform depth when floating is desirable. Such attachments should prove valuable if properly used where the conditions demand. Stringing of the hill may be caused by (a) dirt in the boot, and (b) by a spread check arm. Trouble from the first cause will probably be due to the team having set back on the planter while the shoes were still in the ground. Clean out the boot bottom thoroughly and the rest of the remedy is obvious.

Trouble (b) is less easily detected. If the check arm is spread as is shown at B in Fig. 2, the wire button will let go of the check arm before the valves have been forced wide open, to the result that the kernels will be strung out in the row rather than being dropped well together. By means of a hammer, drive the arm halves together to their original position, but in so doing care must be taken not to get the halves so closely together that binding of the wire will result. The check arm halves can be left straight as shown at A in Fig. 2. Some operators find that stringing is due to a badly worn shoe. If this is determined to be the cause, new parts must usually be supplied.

Clutch Troubles

Clutches on the various planters differ so widely in design that no specific rules can be given that would apply to all makes. Failure of the clutch to grip or release can often be overcome by thoroughly cleaning the parts, and if the striking forces are worn round, new parts may have to be secured. On most planters this means but slight expense and a little patience.

Timing the Plate Rims

Breakage may necessitate removal of the rim which drives the plate. This rim is timed with the pinion on the shaft which drives the plates from the clutch, and when the rim is replaced on the machine the "time" must be reestablished. If the plate rim is out of time with the pinion, inaccuracy will result because the plate itself will not stop at the proper time.

On some machines the cog teeth of the rim and pinion are so marked or constructed that it is very easy to ascertain the proper relation between the two castings. Before removing the rim the operator should carefully seek any such guides so that he may know just how to replace the parts. If no guide is found on the arm and on the shaft pinion, make a mark on each by means of a cold chisel, and then in replacing parts bring these two marks into the same relation to each other as at first. It sometimes happens that after replacing a rim or adding a new one, it breaks as soon as it revolves. This is due to non-timing.

The question is often asked: "Is the disc furrow opener preferable to the ordinary shoe runner?" The single disc opener has better penetration than the shoe and will cut through trash to better advantage, but it throws the soil to one side and covering is made more difficult. The double disc has less penetrating ability than the single disc, but covering can be more easily accomplished after it.

In hard, thrashy ground, then, the disc opener should prove preferable to the shoe opener, but in a well prepared seed bed, well free from surface trash, the shoe is strongly advocated because of its simplicity. The planter with disc openers cannot be considered a heavy draft implement, but the discs carry bearings which must work in soil and one may always expect trouble with such a combination.

Household Editor of
Prairie Farmer

Livestock Farmer's Medicine Chest

By Dr. A. S. Alexander, in Prairie Farmer

When a farmer can employ a competent graduate veterinarian at reasonable expense it always is best to do so, and in all serious cases such expert help should be used even if the expense will be considerable. Unfortunately it is not always possible to find such an expert or he may live at such a distance that an ordinary or trivial case will not warrant the expense of his employment, or the nearest veterinarian may not be a properly qualified practitioner, or is one in whom the stockman has no confidence.

For these reasons every owner of animals should keep some simple remedies on hand, and these are necessary even on farms where professional assistance can readily be had. It should be understood, however, that the untrained farmer should not attempt the administration of strong poisons, alkaloids and many preparations used hypodermically by a graduate veterinarian. Such preparations are extremely dangerous in the hands of the layman and are liable to do much more harm than good. The trained surgeon also should be depended upon for all major operations.

A cupboard may be set apart for storing medicines in a cool, dry place and where freezing will not occur in winter. A glass graduate and scales will be necessary for measuring and weighing medicines. Powdered drugs should be kept in tightly closed glass fruit jars and should be plainly labeled. They may soon lose their strength if exposed to the air. Poisons should be kept on a separate part of a shelf partitioned off for the purpose and away from simple, harmless drugs. Ointments, with the exception of fly blister, should be made up fresh at time of use. Liniment may be prepared and kept indefinitely if well corked.

The medicine case should also have a special division in which to keep a few instruments, bandages, suture silk and absorbent cotton; or better still, these may be kept in a handbag for immediate use as required. The emergency bag should contain a roll of absorbent cotton, several rolled three-yard bandages of unbleached muslin in strips three inches wide, a pound or two of oakum, a spool of strong suture silk, half a dozen suture needles of assorted shapes and sizes, most of them large; a half-ounce, short-barreled, strong-nozzled hard rubber syringe, a two-ounce metal syringe, a cow trocar and canula for tapping a bloated animal, a pair of curved shears, a combination operating knife containing a curved bistoury, a probe pointed bistoury and a strong straight scalpel, a few milking tubes and a teat bistoury, an artery forceps, metal probe, castrating knife and pair of horse clippers.

These will suffice, but there are many other useful instruments such as a clinical thermometer, horse trocar, catheter and dentistry "float," which may be added from time to time. Some of the medicines to be listed later may also have a place in the emergency kit or bag, notably those needed for the treatment of wounds, and at hand should be a strong quart drenching bottle and ten feet of quarter-inch cotton rope with which to hold up a horse's head for drenching. A veterinary force pump is added on a large farm, but its place may be taken by three feet of new lawn sprinkling hose fitted with a large tin funnel. This is used to give a horse or cow a rectal injection. There should also be a six-foot piece of new half-inch rubber tubing for use in giving a cow or mare a vaginal injection.

Simple necessary medicines may best be listed under the following special heads:

Physics

Epsom and Glauber Salts. Average dose for an adult cow, one pound in three pints of warm water. Dose for a horse, 12 ounces.

Castor Oil. Especially useful for young animals. Dose for a calf or foal, from 1 to 6 tablespoonsful shaken up in milk.

Raw Linsed Oil (not boiled, which is poisonous). Average dose, one pint for constipation and to follow a dose of colic medicine, or contain medicine for colic.

Barbados Aloes (freshly powdered). Average dose, one ounce, to be given to an adult horse as a "physic ball."

Wound Medicines

Keep in stock one pint each of carbolic acid and coal tar disinfectant and a gallon can of the latter for dipping and disinfecting purposes. Two teaspoonfuls to a pint of water ordinarily makes a sufficiently strong solution. Bleeding is stopped by applying Monsel's solution of iron on oakum or cotton batting, or applying Monsel's powder. As a wound lotion also keep on hand a mixture of one ounce of sugar of lead and six drams of sulphate of zinc in one pint of water. This is called "white lotion" and should be plainly labeled "poison" and well shaken before use.

Dusting Powders

A dusting powder of equal parts of slacked lime, charcoal and sulphur is useful for application to surface wounds and sores. Boracic acid also is needed and a little iodoform may be added to keep flies away.

Liniments

Keep on hand a pint (pound) each of turpentine and aqua ammonia. One ounce each of these mixed with a pint of soft water, in which two raw eggs have been shaken up and the mixture left for 24 hours, will make a good stimulating liniment; or one ounce of each may be mixed with 6 to 14 ounces of raw linseed oil to make a very strong or comparatively mild liniment.

Lotions

"White lotion" for wounds has already been mentioned. Equal quantities of lime water and raw linseed oil make "carron oil," an excellent lotion for burns. Two to four unces of Goulard's extract and one to two ounces of glycerine in one quart of soft water form a useful lotion for scratches and mud fever of itchiness and "gumminess" of the legs. A good lotion for inflammation of the udder is made by mixing together one part each of fluid extracts of poke root and belladonna leaves and one part of turpentine with five parts of sweet oil, melted lard or camphorated oil. It is made weaker or stronger as required. Anodyne lotion for painful swellings is made by combining equal quantities of tincture of opium, aconite, belladonna and druggists' soap liniment. A small quantity of chloroform may be added. Mouth lotion consists of an ounce of powdered borax or alum in a quart of soft water; eye lotion of half a dram each of sulphate of zinc and fluid extract of belladonna in a quart of soft water.

Tonics

Fowler's solution of arsenic is a good general tonic for rundown, thin, hidebound horses and those afflicted with chronic skin diseases or heaves (broken wind). The average dose is half an ounce (one tablespoonful) given night and morning until one quart has been given. The medicine may then be gradually discontinued, taking at least a week to the work. Dried sulphate of iron (copperas), dose one dram night and morning, is another good tonic, commonly combined with an equal dose of ground gentian root or ginger root, nux vomica, saltpeter and fenugreek as a condition powder. The dose is one tablespoonful of the combination of drugs mixed in the feed night and morning for ten days. Omit sulphate of iron for pregnant animals. Nux is poisonous and must therefore be given with care. It is most useful as a nerve tonic and appetizer.

Colic Medicines

Keep in stock one pound each of laudanum (dose, 1 to 2 ounces); essence of ginger root (dose, 1 to 2 drams); sulpuric acid (dose, ½ to 1 ounce); turpentine (dose, 1 to 2 ounces); granular hyposulphite of soda (dose, 1 to 4 ounces). A dose of each of the first three medicines in a pint of water containing two ounces of hyposulphite of soda will prove effective for most colics. Two ounces of turpentine in a pint of raw linseed oil may be given for "wind" (flatulent) colic, or following the other medicine when the pain of "cramp" (spasmodic) colic has subsided.

Fever Medicines

Powdered saltpeter is an important drug for animals. It is given in the fever of influenza, founder (laminitis) or lymphangitis (milk leg, also for stocking of the legs and other large swellings. A dram is the average dose. Give it every four or six hours in fever, twice daily for swellings, or with tonics as a condition powder, and in double doses for founder or milk leg. Do not give it in colt distemper, when abscesses are forming. It may often be administered in drinking water or a bran mash or damp feed. It also is given in tablespoonful doses once or twice daily for garget of the cow. Beware of aconite often given for fever. It is too dangerous a poison to be safely used by anyone other than a trained doctor.

Blister

An effective blistering ointment is made by melting together three parts of lard and one-quarter part of finely shaved, yellow beeswax, and then stirring it one part of powdered cantharides (Spanish fly). Stir in a tin dish until cold, then store in a capped glass fruit jar. It improves with age. When using this blister clip off the hair, wash the skin clean, dry it perfectly. Tie the horse up short in his stall, rub the blister in for fifteen minutes and then smear on some more blister. Wash the blister off in 48 hours and then apply a little lard daily. Do not cover a blistered part, or rub it on the loins, or on top of the hips, or use it after a poultice, or on irritated skin, or in very hot or cold weather.

Absorbents

Never be without tincture of iodine to swab on swollen glands, tumors, forming abscesses, bony growths, capped or puffed joints, indolent sores or wounds, canker of the mouth in pigs and ringwork spots. It also is useful to inject into abscesses, fistula and lump jaw cavities. Iodine ointment is made by mixing one dram each of iodine crystals and iodide of potash in one ounce of lard. This is used on swellings, sore necks and shoulders, puffs of all sorts, tumors, forming abscesses, ringworm spots and enlargements of the udder. As an absorbent blister rub up one dram of biniodide of mercury with two ounces of the fly blister already mentioned and use on bony growths, such as splints and ringbone, callouses, indolent sores, tumors of the udder.

Worm Medicines

Gasoline is kept on most farms and in tablespoonful doses in six ounces of milk is the best remedy for stomach worms in sheep. Lambs take less in proportion. Two ounces of turpentine in a pint of raw linseed oil is effective as a starting dose for a "wormy horse." Follow with worm powders composed of equal parts of salt, sulphur and dried sulphate of iron. Dose, one tablespoonful night and morning for a week, then skip ten days and repeat. Omit iron for pregnant animals. For worms of swine give one teaspoonful of turpentine in slop for three consecutive days for each eighty pounds of body weight; or one dram of dried sulphate of iron in slop for five successive mornings for each hundred pounds of body weight. Where swine are known to be seriously infested with worms, give eight grains of santonin and five grains of calomel in a little slop for each hundred pounds of body weight. Divide the pigs into lots of five and give the medicine in a little slop after starving the animals for eighteen hours. Care must be taken to give only the doses here prescribed, else damage may be done.

Disinfectants

In the paragraph on wound medicines it has been advised to keep carbolic acid and coal tar disinfectant in stock. To these may be added formaldehyde, bichloride of mercury tablets and permanganate of potash crystals. In disinfecting a stable a solution of four or five ounces of formaldehyde to the gallon, or a 1-1,000 of bichloride of mercury (corrosive sublimate) or a 1-30 solution of carbolic acid or coal tar disinfectant should be used after a thorough cleansing of the premises. For wounds a 1-1,000 solution of corrosive sublimate also is the most effective disinfectant and a 1-500 solution should be used for disinfecting when a spore-forming germ, like that of anthrax, is present. Permanganate of potash is a useful mild disinfectant (antiseptic

and deodorizer) in a 1-5,000 to a 1-50 solution. The weaker solution is used lukewarm for vaginal injection purposes, while the 2 per cent solution is useful for injection into cavities from which come bad-smelling discharges and for swabbing sores (cankers) of the mouth. As a wound lotion it is usual to employ a 2 to 5 per cent solution of carbolic acid, or lysol, or coal tar disinfectant. Carbolic acid is also much used as an internal disinfectant in contagious abortion. Two drams of the acid is well diluted with water and mixed in soft feed for each pregnant cow every other night throughout pregnancy. Peroxide of hydrogen one part and clean water two or three parts is a popular disinfectant for cleansing foul wounds.

Scour Medicines

The farm medicine chest would not be completely stocked without some remedies for diarrhoea or scours. A mixture of one part of salol and two parts of bismuth (first prescribed years ago by the writer) has become a standard remedy among farmers. The average dose is one teaspoonful given two or three times a day and washed down with milk or water. The dose may be doubled in bad cases and for larger calves and foals. Prepared chalk, powdered alum, sulphur, powdered catechu, rhubarb and ginger root are also much used for diarrhoea.

Administering Medicines

Small doses of liquid medicine, such as the average two-ounce dose of a fever medicine or tonic solution, are best given by means of a half-ounce hard rubber syringe. Expert veterinarians sometimes give such medicines of bad-tasting drugs in gelatine capsules, or in form of a "ball." Worm, condition and tonic powders are mixed in damp grain feed. A large dose of liquid medicine is termed a "drench" and is given from a strong, long-necked bottle. A few inches of rubber hose may be fitted on the neck of such a bottle.

To drench a horse, back him into a stall, place a running noose of soft, small cotton rope or "clothes line" upon the upper incisor teeth, under the upper lip, and draw the noose tight, with the knot of the rope to the front. Throw the loose end of the rope across an overhead beam, raise the horse's head, hold it there by means of the rope and pour the medicine into the mouth a little at a time until all is swallowed. Do not squeeze the throat of the horse when giving medicine and never pour the medicine into the nostril. If the horse will not swallow, pour a teaspoonful of cold water into a nostril and swallowing will instantly occur.

To drench a cow, place her in a stanchion or tie her in a stall. Walk up on her right side (milking side). Pass the left hand across her face and into her mouth. Hold her head in a straight line forward and slightly elevated, not turned to one side. Pour the medicine very slowly into the right side of the mouth. Let the head down instantly if the medicine causes the cow (or horse) to cough. Fluid given too fast passes into the paunch and is practically wasted. Administered slowly, it largely goes to the third and fourth stomachs and absorption takes place in the latter.

Sheep have to be very carefully drenched from a bottle to avoid choking. Swine take medicine through a hole cut in the toe of an old shoe thrust into the mouth or from a short, strong rubber hose fitted in the neck of a strong bottle. Dogs take medicine in capsules inserted in meat or from a bottle or spoon emptied into a pouch formed of the lip and cheek.

Avoid "doping" animals unnecessarily. Medicine should only be given when the animal is sick, should be the right medicine, and is best prescribed by an expert.

VALUE OF LABOR

The United States Department of Agriculture found in 1855 that it required four hours and 34 minutes of human labor to produce a bushel of corn. At the Minnesota experiment station it has been found recently that 45 minutes of human labor is about the average time required for the same work. In other words, human labor is worth six times as much as it was 60 years ago, due to the use of better machinery, better varieties of corn and better soil management.

The Story of Frank Mann's Wonderful Farm

Systematic Use of Limestone, Phosphate and Clover Have Given Him Steadily Increasing Yields

So many of our readers have asked us for a complete story of Frank Mann's farm that we have asked him to prepare it and are publishing it herewith. The increase in crop yields, following his methods of soil treatment, are shown in the following table:

	First Rotation	Second Rotation	Third Rotation	Fourth Rotation	Highest Yields
Corn	72	75	81	85	93
Oats	70	81	93	98	115
Wheat	32	41	51	57	63

BOIS D'ARC farm consists of nearly 500 acres adjoining the city of Gilman, Iroquois county, Ill. The farm lies near the edge of what is called the Iroquois Lake basin, and though in its natural state it was too wet for all the land to be successfully farmed, it was not wet enough to be classed as swamp land. It is essentially the undulating prairie land of the Corn Belt.

Previous to 1878 considerable surface drainage was secured by means of open ditches following the natural water courses, and farming had been done on the higher parts of the fields. Considerable tiling was done between 1878 and 1886, when the land was included in a drainage district, which provided better outlets, with large tile laid in some of the old open ditches.

Tiling was continued for a few years until most of the fields were supplied with lateral strings about four rods apart, and with mains and submains, with a capacity to remove standing water within about 24 hours after a heavy rain. Most of the mains and submains are laid with a fall of about one inch per hundred feet, while the laterals have from one to several inches fall to the hundred feet.

The farm is divided principally into 80-acre fields, though there are some subdivisions of these, because of the difference in the soil types, and for convenience in operating.

Many Types of Soil.

There are a large number of soil types on this farm, and a soil expert would probably classify them into about 17 different types, though in farming only a few general differences are recognized. In general, the soil is called the brown silt loam of the Early Wisconsin glaciation, and it varies from the light phase to the heavy phase of brown silt. Of the surface soil on the farm there is a light sandy silt, light silt, medium silt, and a heavy phase, approximating black clay loam. There are many variations in the subsoil; sand, several feet in depth; a pervious mixed clay and silt; yellow silty clay; a rather tight or impervious clay, and a dark silty clay.

Most of the farm is of the level or gently undulating land with but a few feet difference in elevation between the higher and lower parts of the fields; and as a rule, the higher the ground the lighter the soil. On the high portions there may be about a foot of dark colored soil,

while on the low portions there may be two to three feet of dark earth.

About a hundred acres is of a different formation and lies higher than the rest of the land. This higher land is mostly a light sandy loam with a sandy subsoil, and the dark colored surface varies from a little less to a little more than a foot in its natural condition.

The Soil Analysis.

Analysis of various samples showed there was limestone in the surface or subsoil in the level and lower portions, in the subsoil of the higher portions, but none in the surface; and no limestone in either the surface or subsoil of the higher land with the sandy subsoil. The phosphorus varied from 1000 to 1200 pounds per acre in the surface soil of the level and undulating land, and from 800 to 1000 in the higher sandy land. The potassium in surface and subsoil is about the average of corn belt soils, and largely in excess of any possible requirements.

In 1866 not a single tree was growing on the whole farm, but in the few years following large plantings were made of young trees of several kinds for nursery purposes; a number of ash, maple, walnut groves were planted, some of which are still standing.

More or less livestock has been kept on the farm since about 1880. For about 10 years there were from 30 to 40 colts and horses, 100 to 200 hogs, and from 40 to 50 cows—the second herd of pure-bred Holsteins in the state. From 1900 to 1912 from 40 to 50 dairy cows were again maintained, and since that time only about a dozen cows, work horses and a few hogs comprise the livestock. As the fields nearest the barns had the poorest soils, practically no manure was ever hauled to the fields farthest from the barns; and one of these 80-acre fields has never had a load of manure, though it has been cropped every year since 1878—42 crops in all.

The writer commenced farming operations in 1878, and by 1879 enough drainage had been provided to permit farming in 80-acre fields without much interference from the open ditches.

Rotation Started in 1879.

On four 80-acre fields a rotation of clover, corn, corn, oats was started,and clover was seeded with the oats in 1879. With but two or three breaks, due principally to grasshoppers, this rotation has been maintained ever since. The west 20 acres of two of these 80's included so much of the light sandy type of soil, which would not grow good clover, they were separated from the rest of the half section, and operated in a different method in connection with the rest of the light sandy types.

The fields with the thin sandy type of soil were used for pasture a part of the time. After two or three years of pasturing grain crops were grown for two or three years. After about three years the crops became so small they were again seeded to timothy and clover for pasture. Since 1904-8 these fields have been cropped regularly in rotation, because with the use of limestone and phosphate large crops of clover can be grown in rotation.

On the half section, where clover grew in rotation, common red clover was used for a few years, but later some alsike and timothy were included in the seeding. The first crop of clover was cut for hay, and the second crop was plowed under late in the fall, though frequently it was necessary to defer some of the plowing until early spring, and if possible before much growth had been made.

Until mineral treatments were commenced in 1903 the average yield of hay was from one ton to 1½ tons per acre, in first crop; and the growth to plow under, consisting of the second growth and residues of first years growth, was about a ton.

With the use of phosphate there came a large increase in the amount of clover grown, and the hay crop was increased from 2 to 2½ tons, with a corresponding increase in the late growth. The mixture used became common red, alsike, alfalfa and timothy, as this gives a larger growth after the hay crop for plowing under.

What Is Clover Worth?

What is this clover worth when plowed under as suggested? Comparing yields on land where corn and oats have been grown without clover, with yields on similar land where clover has been in rotation for many years, shows that the

clover has been worth 40 bushels of corn and 15 bushels of oats in each rotation. Corn without clover yielded 34 bushels as an average for five years; oats without clover in the rotation, yielded 32 bushels. With clover in rotation, the corn yield was 54 bushels and oats was 47. When corn sold at 50 cents per bushel this gave a value of at least $12 to $13 per ton for the hay plowed under. With corn at a higher price the value of the clover would be correspondingly higher.

Trials have been made to see whether more clover than the second crop plowed under would give any increased value. In some cases the first crop was clipped and left on the ground for plowing under with the second crop; and in other cases mammoth clover has been grown and the whole crop plowed under; but the effect of the larger amount of clover has been more or less injurious. It has induced a larger growth of stalks and straw, with shallower root systems and more injury from drouth; later maturity; more smut, mold and scab, and more soft corn. It has caused more excess nitrogen with all of its attending evils.

Soybeans were grown when grasshoppers destroyed the clover, but it was considered that when soys were allowed to mature, they were worse than a grain crop from a fertility standpoint The weight of the soy nodules was 500 pounds per acre (based on what was taken from a square rod), but in these nodules there remained but about 3½ pounds of nitrogen; as, in maturing, the soys had so completely withdrawn the valuable food materials from the roots, they were more exhaustive to the soil than would have been a grain crop. These soys probably took about 80 pounds of nitrogen from the soil and another 80 pounds from the air, but it was nearly all removed in the mature crop.

Something More Needed.

For years it was considered that nothing more need be done than to grow clovers in rotation, but with the continued use of clover there was grown large stalks and rank straw, but without any material increase in the quantity of grain produced. Enough stalks for 150 bushels corn per acre, and straw enough for as large a yield of small grain were frequently grown, and with yields approximating 50 bushels. Farming was discouraging, as it seemed as if nothing could be done towards increasing actual yields, as about every improved plan had been tried.

About this time the Illinois Experiment Station began the systematic study of soils, and it was found that some soils responded to limestone, some to phosphorus, some to nitrogen and some to potash.

Fertility Experiments.

To parts of a field to be in second-year corn were given various applications: 10 tons of Chicago yard manure per acre (manure contains all), dried blood to another part, rock phosphate, limestone and potash to other parts, in a spirit of inquiry to see what the soil wanted.

The manure gave an increase of 10 bushels of corn per acre; bone meal and rock phosphate 17 bushels increase; dried blood, limestone and potash had no beneficial effects in the following crop.

As the nitrogen of blood did not seem to be needed, it was assumed that the nitrogen of manure was not needed; as phosphorus in either form gave good returns it was considered that the phosphorus of the manure was the main cause of the increase it gave.

As the one crop removed about as much phosphorus as was applied in the manure; and as most of the phosphorus of bone meal and rock phosphate remained in the soil; and as the rock phosphate cost much less, it seemed to be the best remedy for the conditions. Its systematic use was commenced and has been continued ever since without missing a treatment in regular order.

In the first rotation on each field there was applied 1,000 pounds of raw phosphate per acre, and by operating the distributor while spreading, heavier applications were made to the higher parts of the fields, and lighter applications to the lower. In this way there seemed to be better values returned from an application than if it had been distributed evenly

Since the first rotation, the regular application has been one ton per acre

in each four-year rotation; the application being made to the clover field before plowing. Intermediate applications have also been made during the rotation on some fields, so that now the tilled fields have from 3½ to five tons per acre as the total amount applied.

Yields Go Up.

During the first rotation on the half section where the crops are corn, corn, oats and clover, the average yield of corn was 70 bushels and oats 70 bushels. In the second rotation, with the second application of phosphate in connection with clover, the corn yield was 74 and the oats 78; in the third rotation, the corn was 81 and the oats 89 bushels; in the fourth rotation, with the fourth application of phosphate the corn yield was 85 and the oats 93 bushels. A few fields severely injured by extraneous causes, such as hailstorms, have not been included.

On the remainder of the farm, the fields contain more or less of the lighter sandy soil, and the rotation has been corn, oats, wheat and clover. As most of this ground has no limestone in either surface or subsoil, or a large humus supply, it was necessary to apply limestone as the first step to grow clover, and from three to five tons per acre were applied as an initial application.

Most of these fields had been given considerable manure in previous years, though almost none since the rotation was started. There are four fields in this rotation; one of 30 acres, one of 35 acres, one of 40 acres and one of 20 acres. Parts of some of these fields have grown alfalfa for a number of years, though a part of each field has been in the rotation.

Regular applications of phosphate have been made to the clover field before plowing in each rotation, and extra applications have been made to the oats stubble before plowing for wheat, so that these fields now have had four tons of phosphate per acre, and one field has had five tons.

Some of these fields have been in pasture for several years before the rotation was started, and manure had been applied. In the first rotation the corn yield was 72 bushels, oats 70, wheat 32; second rotation, corn 75, oats 81, wheat 41; third rotation, corn 81, oats 93, wheat 51; fourth rotation, corn 85, oats 98, wheat 57.

In two favorable seasons the corn made 93 bushels, the oats 102 and 115 bushels and the wheat 62½ and 63 bushels.

Prairie Farmer's Soil and Crop Editor

THERE IS A DIFFERENCE IN BANKS

We are very definite in our ideas of what a Bank owes its customers—and of the attitude which it should take toward them.

There are no favored few here. Every patron stands upon exactly the same footing—entitled to all the service we can render properly.

There IS a difference in Banks—put us to the test.

The First National Bank

Farm Insurance Plus
High Class Service

Our responsibility to our customer does not end when we write his insurance and receive the money for it.

That is merely the beginning of a quality of service that continues until every loss is promptly and satisfactorily settled.

You can enjoy this kind of service by writing us or calling on us.

Your Banker Knows

THERE are three factors absolutely necessary in any sound investment: (1) Safety of principal; (2) A continuing market and (3) Highest interest return consistent with safety.

Opportunities for investment meet you at every turn, but it requires experience and expert knowledge to distinguish the good from that which is undesirable.

Your local banker has this necessary experience and knowledge. Consult him about your investments. He will gladly counsel and advise with you. You can be sure that the security he suggests will be safe, salable and profitable.

Spotted Poland China Hogs

THE BEST ON EARTH

Do you need a heard boar? I know individuality and I know blood lines. I know value. I have never disappointed a customer on a gilt, sow or boar I bought for him. Let me make you one of my customers.

I am also a breeder. I have from 200 to 400 head on hand at all times and can sell you from my own herd, and anything I send you must suit you or you can ship it back to me.

I refer you to all the breeders and the Hillsboro State Bank or any bank in Fountain Co.

EQUITABLE BUILDING ASSOC'N

DANVILLE, ILLINOIS

SAVINGS

For those who desire to make monthly or weekly savings, **running stock** is issued at any time, with required dues of fifty cents per share per month, or of ten cents per share per week **No fines are charged** if payments are not made when they are due. **No back dues are required,** as each shareholder is treated independently.

INVESTMENTS

We receive deposits of any sum of money, at any time. On these no dues are required to be paid, but the privilege of making future payments, either regular or irregular, is given.

We also issue "Single Payment Shares" with a payment required of $50.00 per share. Each of these forms of investment participates in the full earnings of the Association, and is especially satisfactory for those who have idle money, or those whose income is not regular.

EARNINGS

The full net profits of the Association are divided among the members, in proportion to their investments, and are credited on their pass books March 1st of each year.

Withdrawals are paid on March 15th and on September 1st at full earning value to that date.

SPECIAL NOTICE

To the first One Hundred investors who present this advertisement at our office we will give a rebate of the membership fees on the shares subscribed for.

BUSINESS BY U. S. MAIL SOLICITED

$1,000,000

We thank our many customers and friends all over Indiana and parts of Illinois and Ohio for a business running now at the rate of a million dollars a year, which has grown from about $300,000 five years ago. Selling on a close margin and treating everybody right has enabled us to build up this large business. The more goods we sell, the closer margin we can operate on. We are selling nearly all the time at from $2.00 to $10.00 per ton cheaper than other large dealers. We sell

ALL KINDS OF LIVE STOCK FEED

Feed for the hog, horse, cow or poultry. Feeds that are cheaper than corn. Feeds to be fed with corn. Also all kinds of FIELD SEEDS such as Timothy, Clover, Alfalfa, etc. We carry the largest stock of feeds in the state. Will sell you 100 pounds, a ton or a carload. We ship everywhere. Write for latest price list quoting and describing about 40 different kinds of feeds and seeds.

The Daily Clintonian

CLINTON, INDIANA

Is the only daily newspaper published in Vermillion, Parke or Fountain counties. Ask your neighbor who takes it as to its quality, or send in a trial subscriiption of $1.75 for six months, by mail, in Vermillion or any immediately adjoining county.

The Daily Clintonian strongly believes in and boosts better farming methods and the Farmers' Federation.

No farm sale should be conducted without advertising in **The Daily Clintonian.** Sale bills, letter heads and other printing promptly done at reasonable prices.

BETWEEN TWO BROOM CORN ROWS

That's where we "growed up"—in overalls; but yours is different, most every day you are dressed up in your Sunday-go-to-meetin' suit. To keep it cleaned, pressed and repaired is your greatest worry. Don't do it.

Our most modern equiped dry cleaning plant and skilled workmen can keep the old clothes looking like new.

Send in by parcel post or drive to our door

Swine Breeders Pure Serum Company

U. S. VETERINARY LICENSE No. 48

An Indiana Co-operative Institution, owned and operated by swine breeders and feeders to produce pure, potent, throat-bled serum and virulent virus for the immunization of their own as well as other owners' hogs against hog cholera.

SWINE BREEDERS PURE SERUM has earned an unassailable reputation by its universal and continued success.

Results are what you want. Ask the owner who is using our serum. Come visit our plant and observe our methods. The best is always the cheapest. Give us a trial and we will convince you.

Carry your Immunity Insurance with a company which is manufacturing a reliable serum for the protection of its own members.

Your business is solicited. Write us for further information.

We believe it would be to your interest when you have any stock ready for market to give OUR FIRM due consideration. It is our endeavor at all times to render you a class of service you have a right to expect; we will assure you the full market value; no shipments too small to be appreciated or too large to receive our prompt and careful attention. It is not what you come in with but what you go out with. YOUR INTERESTS ARE OUR INTERESTS.

As we meet you on the level, we'll treat you on the square.

Soliciting your patronage, thanking you in advance for any favors shown us, we are,

Very truly yours,

IMPERIAL COTTO BRANDS:

Cotton Seed Meal, Cold Pressed Cake, Screened Cracked Cake, Old Process Linseed Oil Meal or Cake, Stockers Feeding Molasses, Flour Middlings, Red Dog, Bran, Middlings, Digester Tankage

Straight Car Lots, Mixed Cars, Ton Lots

822 Exchange Ave., U. S. Yards, Chicago, Ill.

Phone Boulevard 181-182-183

All dairy men and cattle feeders are now using Cottonseed Meal or Linseed Oil Meal in their feeds. Are you? Is the roughage which you grow (such as corn silage, corn stover, timothy or prairie hay) good feed without either one or the other of these high grade concentrates?

Experiments conducted by the State Agricultural Schools show that one or the other of these concentrates must be added to reduce your feeding costs. Why not start in right now?

We are always in position to give you our customary expedite service for these or any other feeds in straight car lots, mixed car lots or ton lots.

Write us for prices.

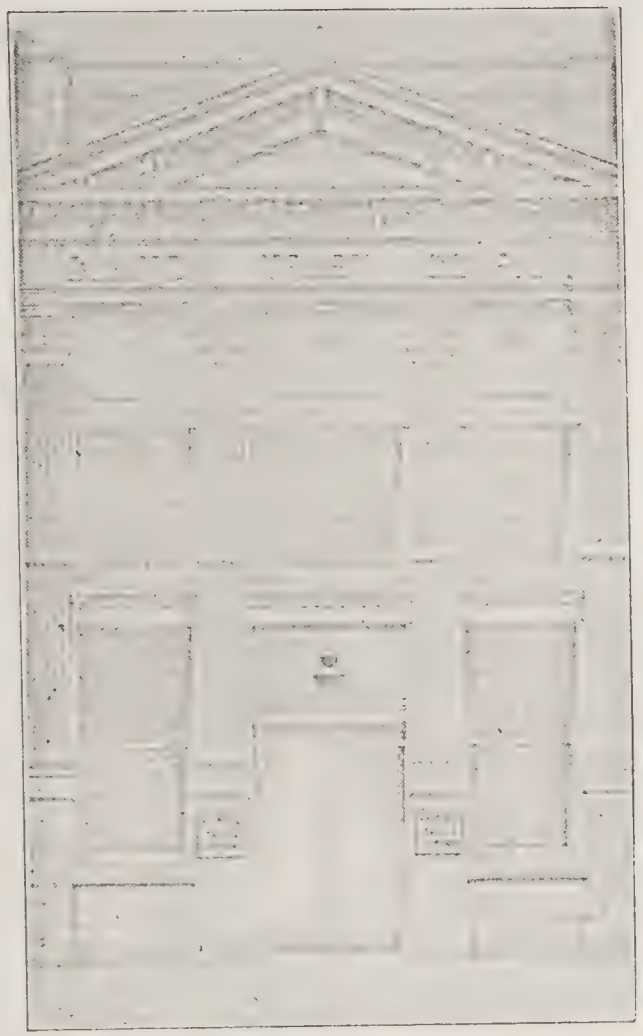
Clinton Trust Company
of
Clinton, Ind.
Capital $50,000.00



How fortunate it is for us that the men who founded this bank set out with the simple idea of trying to give to the people of this vicinity a safe and convenient place to do their banking business. That clear-cut determination has led us to adopt policies which are careful and conscientious and business principles which are sound and substantial. The net result has been a most unusual and cordial relation between ourselves and our public—based on the confidence which people have learned to place in this bank and the service which it renders. If you are not now a customer we solicit your patronage.

CLINTON TRUST COMPANY

Vermillion County Breeders' Directory

This list includes all farmers in Vermillion County who own one or more pure bred animals. Star (*) indicates farmers who raise breeding stock for sale.

RELIABLE JEWELRY

There's safety, satisfaction and saving in patronizing this store. Poor jewelry often looks as good as the best—at first. The only safe way is to patronize a store of known reliability. Everything we show you is precisely what we say it is—inside and out.

VALUE OF LABOR

The United States Department of Agriculture found in 1855 that it reuqired four hours and 34 minutes of human labor to produce a bushel of corn. At the Minnesota experiment station it has been found recently that 45 minutes of human labor is about the average time required for the same work. In other words, human labor is worth six times as much as it was 60 years ago, due to the use of better machinery, better varieties of corn and better soil management.

For Cattle, Sheep & Hogs

EAR TAGS, BUTTONS & PUNCHES.

"Ben-Hur" Serves Whole House

Here is a servant that is always "on the job" day or night--never "kicks" on long hours, works as cheerfully in your kitchen as in your parlor, for wages ridiculously small.

The BEN-HUR Carbide Gas Machine

has many special features found in no other. Heats your flat iron at a cost of about one cent an hour, —supplies hot water for bath, kitchen or laundry, cooks your meals, all at trifling cost—and in lighting your house, Ben Hur shines.

Think of having plenty of the finest, brightest and best light ever made! The Ben Hur light is the nearest like daylight of any artificial light. Is not only better than electricity but costs less to put in and run. No danger from crossed wires, shocks or fires from lightning. No machinery to make a noise or get out of order.

Ben Hur is automatic—runs itself. Write today for full information Free. Send rough diagram of your house. Remember, the cost of installation and the cost of running is very little.

Johnson Carbide Gas Company
Dept. B, Crawfordsville, Ind.

We Shop for You

—and think of the trouble it will save you when it is inconvenient for you to come to the store in person.

All you need to do is to write us a letter specifying what you want and enclosing price you wish to pay. Our expert shopper will do the rest.

Money will be cheerfully refunded if our selection does not suit you. Why not give our Mail order Service a trial,

The Geo. W. Graham Co

Quality - Dependability - Durability

THREE THINGS THAT MAKE
A BUSINESS SUCCESSFUL

In buying furniture, those three things should be carefully considered, as the buying of furniture means buying something that you expect to keep for years.

It is those three things that have been applied in building up this business, until today it is at the head of the furniture business of the state. Go to any of our stores—Brazil, Clinton, Linton or Terre Haute and see how well you will be satisfied with our business methods. We invite your business.

Scott & Hart Stove and Furniture Co.

Weaver, Geo L.,	Tangier R.A.	Ford

Terre Haute, Ind.

Terre Haute is the educational center of the state. Here you will find located the State Normal, Rose Polytechnic, St. Marys of the Woods and the Wabash Commercial School. This, therefore, is the logical city if you think of entering school.

BUSINESS TRAINING NECESSARY

Some training along business lines is necessary, and it costs no more to get the best possible. The president of the Wabash has been training young people right here in Terre Haute for twenty years. We can train you. Write for full particulars.

Wabash Commercial School

FULLY ACCREDITED

M. P. AKERS, President E. C. STEWART, Vice President

Clinton's Leading Department Store

EVERYTHING IN LADIES' READY TO WEAR, DRY GOODS, HOSIERY AND UNDERWEAR

Give us a trial the next time you need anything in this line.

DON'T THROW AWAY YOUR LEAKY RADIATOR!

Don't "dope" the leaky radiator. It stops circulation. We can build it up and fix it like new. We put in new Tubes and new Cores and any other parts.

EXPERT WORKMEN. ALL WORK GUARANTEED. OUR PRICES ARE RIGHT

ELITE RADIATOR SHOP

We solicit out-of-town business. Express them to us or while in town shopping leave your car and we can give you real service.

Every road has two ends—at one end the farm, at the other the country town. Each depends on the other, and both prosper together. When broad-minded merchants and the progressive farmers work together for the good of the community, then you have a community worth living in.

THE TRACTIONEER'S DREAM

By George Fitch.

The tractor on the farm arose
  Before that dawn at four,
It drove the cows and washed the clothes
  And finished every chore.
Then forth it went into the field,
  Just at the break of day;
It reaped and threshed the golden yield,
  And hauled it all away.

It plowed the field that afternoon
  And when the job was through
It hummed a pleasant little tune
  And churned the butter, too.
And pumped the water for the stock,
  And ground a crib of corn,
And hauled the baby 'round the block
  To still its cries forlorn.

Thus ran the busy hours away
  By many a labor blest;
And yet, when fell the twilight gray
  The tractor had no rest.
And while the farmer, peaceful eyed,
  Read by the Tungsten's glow,
The patient tractor stood outside
  And ran the dynamo.

When you do not know what merchant sells the merchandise or machinery you are in the market for, consult the "Buyers' Guide Index"

GILBERT'S

CLINTON'S RELIABLE STORE

133-135 MAIN STREET :: :: CLINTON, INDIANA

WHY ARE WE PARTICULAR WHEN WE SERVE YOU?

The Store where Quality counts is often called "the store for particular people" and one needs to make but a single purchase there to demonstrate the aptness, fairness and truthfulness of the declaration.

We've always found that it pays to be particular—pays the customer and ourselves. It lends individuality to our merchandise, stamps a purchase with the hall-mark of distinction and establishes trust in the honesty of our intentions. Goods sold with the view of deceiving seldom stay sold—goods sold where Quality counts stay sold and create permanent trade from particular people.

WE CARRY NATIONALLY ADVERTISED MERCHANDISE

CLOTHING:
Hershberg's "Master Craft"

FURNISHINGS:
Lion Shirts and Collars
Munsing Union Suits
Armor Plate Hosiery
Crown Brand Overalls
Tom Sawyer Blouses and Shirts for Boys
Dubbelbilt Suits for Boys

READY-TO-WEAR:
Printzess Coats and Suits
Bischof Coats and Suits
Queen Dresses
Bon Ton Corsets
Kayser Gloves
Pictorial Review Patterns
Wirthmore Waists and Blouses
Complete line of Dry Goods and Notions

H. V. NIXON, President B. R. NIXON, Cashier

R. H. NIXON & CO.'S BANK

:: ESTABLISHED 1872 ::

A Private Bank Under State Supervision

UNLIMITED LIABILITY

This bank has been going on year after year with the same policy, doing a good, sound business all the while with the same kind of people. Such a bank is prepared for hard times or whatever comes and ready to do what a real bank should do—take care of the good people who need accommodation. We are glad to say to our customers that we are loaning and will loan at our usual terms.

Mail us your films for developing and printing.

Harmon K. Morgan
DRUGGIST
Clinton, Indiana

Highway Construction.

From the Bureau of Public Roads of the Department of Agriculture it is learned that for the next three years appropriations amounting to $574,000,000 have been made by the Federal Government and by the individual states for road building and that much of this "good roads" work is being done in agricultural districts. —The Magazine of Wall Street.

THIS SILO
COSTS NO MORE

Than a good wood stave silo. It is cheaper than many types that can, and do, go to pieces from natural decay and fire, wind or lightning. Silos built by the POLK SYSTEM JUNIOR machine are solid concrete, perfectly constructed and lasts forever. Write us for facts and figures.

VIABILITY OF GARDEN SEEDS

In his book, Productive Vegetable Growing, Prof. John W. Lloyd, of the University of Illinois horticulture department gives the following as the length of time seeds may be expected to retain their vitality:

	Years		Years
Asparagus	5	Mustard	4
Bean	3	Okra	5
Beet	6	Onion	2
Cabbage	5	Parsley	3
Carrot	4	Parsnip	2
Cauliflower	5	Pea	3
Celery	8	Pepper	4
Corn, Sweet	2	Pumpkin	5
Cress	5	Radish	5
Cucumber	10	Rhubarb	3
Eggplant	6	Salisfy	2
Endive	10	Spinach	5
Kale	5	Squash	5
Kohlrabi	5	Tomato	4
Leek	3	Turnip	5
Lettuce	5	Watermelon	5
Muskmelon	5		

It is always safest to test seeds that have been kept more than a year before planting, because they are not always kept under the best conditions and if not will deteriorate faster than is indicated in the foregoing table.

Litter Mark Chart.

GENERAL FARM DATA for FOUNTAIN COUNTY, INDIANA

FROM 1910 CENSUS

Population		20,439
Number of all farms		2,098
Color and nativity of farmers:

PROTECT YOUR HONEST DOLLAR

To Prairie Farmer Readers—

Don't buy cheap, unadvertised goods, but protect yourself when buying by insisting on getting from your dealer only—

All Goods Advertised in Prairie Farmer are TRIPLE-G Goods.
All Goods Advertised in This Directory are TRIPLE-G Goods.

When the local dealer says in his advertisement:

"We Sell *and* Recommend the Following TRIPLE-Guarantee Goods"

as in any advertisement in Prairie Farmer or in this Directory, it gives you this TRIPLE-Guarantee

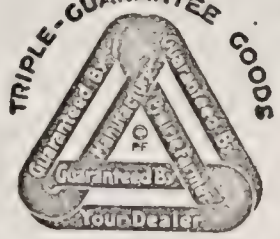
1st That the manufacturer of the goods stands back of them.
2nd That the Prairie Farmer stands back of them.
3rd That the merchant handling the goods stands back of them.

"TRIPLE-Guarantee Goods"

© PF 1918

Are the best value for the money.
Safest to buy.
And Satisfaction is absolutely insured.

What Are "TRIPLE-G" © PF 1918 Goods?



WHY should you ask for them and refuse any other kind?

WHEN a reader of Prairie Farmer goes into a store to buy, he is assured of getting full value for his money if he insists on buying only well known advertised goods and refusing to buy any unknown brand substitute.

WHY? Because advertised goods are well known goods that are backed up with the guarantee of PRAIRIE FARMER and the manufacturer. If the goods are not as represented in the advertising, or do not give full satisfaction, this TRIPLE GUARANTEE means that you have only to make your complaint and that any just claim will be fairly considered and your money paid back in case the goods are not as represented. This is PRAIRIE FARMER'S FAIR PLAY POLICY with its readers. We back up every advertisement in PRAIRIE FARMER and guarantee honest treatment. No humbugs, swindles or cheap substitute goods (that are made to sell and get the customer's money on false pretenses) are advertised in PRAIRIE FARMER. Buy the goods advertised in PRAIRIE FARMER and in this Directory and you are taking no chances. You are guaranteed satisfaction because all goods we advertise are

TRIPLE-GUARANTEED GOODS

© PF 1918 ***Guaranteed by the Manufacturer, the Dealer and the Publisher.***

In Union There is Strength

The Keynote of Prairie Farmer's Protective Union is to Serve and Protect Prairie Farmer Readers

The greatest service rendered by Prairie Farmer's Protective Union is in investigating investment schemes, swindles, etc., and giving our members full information about them. Do not invest in any proposition, however attractive, until you have written us about it. If an agent calls on you with any scheme, with a new variety of seed, with a live-stock remedy, or with anything else about which you are not fully informed, write us before investing any money or signing any papers. Send us all the printed matter about the proposition that you can get, and we will make a full and impartial investigation and report promptly.

This service has already saved members of the Prairie Farmer's Protective Union thousands of dollars. We want to serve you, and the service will save you money.

If you have subscribed for Prairie Farmer and for the Directory you thereby become a member of Prairie Farmer's Protective Union. There are no other dues or charges.

Your certificate of membership is printed below. It entitles you to the full service of Prairie Farmer's Protective Union. Make use of this service freely by writing us whenever you want help or information.

Certificate of Membership

This certifies that .....
is a member in good standing of Prairie Farmer's Protective Union, and is entitled to the full service of Prairie Farmers' Protective Union without charge for the period of his paid-up subscription to Prairie Farmer. All communications and requests for service should be addressed to

THE LEADER

Lafayette's Best
Department Store

CORNER 9th AND MAIN STREETS

LAFAYETTE INDIANA

"Reifers"

A modern furniture store whose business growth has been accomplished through the medium of the satisfied customer.

We started in business firm in the conviction that an institution which bought honest goods—told the truth about them—gave intelligent, helpful [illegible] to dissatisfied patrons, could never fail to reap its full reward in public patronage.

This store has honestly lived up to those principles in its 25 years of rapid growth.

During that time we have played fair with every customer, and found the public has been appreciative. We have had faith enough to believe that in dealing square with our customers, they would deal square with us. We have found the buying public 99% honest. Our liberal store policy has seldom been abused

We want your trade only after we have satisfied you. Our 25 years of expansion and growth built upon the principles above outlined is our assurance to you we can make good.
